

Artificial turf maintenance specialists, *sweeping the country!*

### The Sweepfast System Triangular Brush.

The triangular brush is designed to work on sand filled artificial surfaces it will also work on sand dressed or water based systems. Ideally it should be used during completely dry periods.

Aggressive brushing can be achieved using the yellow bristles downwards. In this position the brush can be weighted with a standard 17kg goalpost weight, the area to be treated should be brushed in both directions overlapping 50% on the second pass. The weight should then be removed and the brush used on the reverse side, towing a cleansweep machine behind at this stage will greatly assist in the redistribution of the infill into the carpet.

More routine brushing can be achieved using the white bristles without the weight.
